Our new model Claude 2.1 offers an industry-leading 200K token context window, significant reductions in rates of model hallucination, system prompts, tool use, and updated pricing to improve cost efficiency.

You can now relay roughly 150K words or over 500 pages of information to Claude. This means you can upload codebases, financial statements, or long literary works for Claude to summarize, perform Q&A, forecast trends, compare and contrast multiple documents, and more.

Claude 2.1 has made significant gains in honesty, with a 2x decrease in false statements compared to Claude 2.0. The model has demonstrated a 30% reduction in incorrect answers and a 3-4x lower rate of mistakenly concluding a document supports a particular claim. This enables enterprises to build high-performing applications that solve business problems with more trust and reliability.

Claude 2.1 includes a tool use feature that allows the model to integrate with users' existing processes, products, and APIs. This means that Claude can now orchestrate across developer-defined functions or APIs, web search, and private knowledge bases.

We're enhancing our developer experience with a new Workbench feature in the Console that makes it easier for Claude API users to test prompts. We're also introducing system prompts, which allow users to provide custom instructions to structure responses in a more consistent way.

Claude 2.1 is available now in our API, and is powering [claude.ai](#) for both the free and Pro tiers. Usage of the 200K context window is reserved for Claude Pro users.
